# Contents

Preface .......................................................................................................................... v
Contributors .............................................................................................................. xi

1 What Would Thomas Henry Huxley Have Made of Prion Diseases?
   Rosalind M. Ridley .................................................................................................. 1

2 Prion Protein as Copper-Binding Protein at the Synapse
   Hans A. Kretzschmar, Tobias Tings, Axel Madlung,
   Armin Giese, and Jochen Herms ........................................................................ 17

3 A Function for the Prion Protein?
   David R. Brown and Ian M. Jones ................................................................. 31

4 Prion Protein Peptide: Agents of Death for Neurons
   David R. Brown ................................................................................................. 51

5 Characterization of Bovine Spongiform Encephalopathy
   and Scrapie Strains/Isolates by Immunochemical Analysis
   of PrPSc
   Martin H. Groschup, Frauke Junghans, Martin Eiden,
   and Thorsten Kuczius ..................................................................................... 71

6 Differential Targeting of Neurons by Prion Strains
   Stephen J. DeArmond ....................................................................................... 85

7 Transgenic Studies of Prion Diseases
   Glenn C. Telling .................................................................................................. 111

8 Prions: From Neurografts to Neuroinvasion
   Markus Glatzel, Sebastian Brandner, Michael A. Klein,
   and Adriano Aguzzi ............................................................................................ 129

9 Cellular and Transgenic Models of Familial Prion Diseases
   David A. Harris, Roberto Chiesa, Antonio Migheli,
   Pedro Piccardo, and Bernardino Ghetti ......................................................... 149

10 Central Nervous System Inflammation and Prion
   Disease Pathogenesis
   Samar Betmouni and V. Hugh Perry .................................................................. 163

11 The Electroneuropathology of Prion Disease
   J. Richard Greene ............................................................................................... 181
## Contents

12 Transmissible Spongiform Encephalopathy Neurobiology and Ultrastructure Suggests Extracellular PrP$^{sc}$ Conversion Consistent with Classical Amyloidosis  
*Martin Jeffrey and Jan R. Fraser* .................................................... 199

13 Conformation as Therapeutic Target in the Prionoses and Other Neurodegenerative Conditions  
*Thomas Wisniewski, Einar M. Sigurdsson, Pierre Aucouturier, and Blas Frangione* ...................................................................... 223

14 Prions of Yeast: From Cytoplasmic Genes to Heritable Amyloidosis  
*Reed B. Wickner, Herman K. Edskes, Kimberly L. Taylor, Marie-Lise Maddelein, Hiromitsu Moriyama, and B. Tibor Roberts* .............................................................................. 237

Index ........................................................................................................... 269
